Package 'ParallelLogger'

June 28, 2018

| Type Package |
|---|
| Title Support for Parallel Computation, Logging, and Function Automation |
| Version 1.0.0 |
| Date 2018-06-28 |
| Maintainer Martijn Schuemie <schuemie@ohdsi.org></schuemie@ohdsi.org> |
| Description Support for parallel computation with progress bar, and option to stop or proceed on errors. Also provides logging to console and disk, and the logging persists in the parallel threads. Additional functions support function call automation with delayed execution (e.g. for executing functions in parallel). |
| License Apache License 2.0 |
| VignetteBuilder knitr |
| Depends R (>= $3.1.0$) |
| Imports snow, XML, jsonlite, methods, utils, mailR |
| Suggests testthat, shiny, DT, knitr, rmarkdown |
| NeedsCompilation no |
| RoxygenNote 6.0.1.9000 |
| R topics documented: |

 ${\it addDefaultConsoleLogger}$

Add the default console logger

Description

Add the default console logger

Usage

Index

addDefaultConsoleLogger()

Details

Creates a logger that writes to the console using the "INFO" threshold and the layoutSimple layout.

```
logger <- addDefaultConsoleLogger()
registerLogger(logger)
logTrace("This event is below the threshold (INFO)")
logInfo("Hello world")
unregisterLogger(logger)</pre>
```

addDefaultFileLogger 3

```
addDefaultFileLogger Add the default file logger
```

Description

Add the default file logger

Usage

```
addDefaultFileLogger(fileName)
```

Arguments

fileName

The name of the file to write to.

Details

Creates a logger that writes to a file using the "TRACE" threshold and the layoutParallel layout. The output can be viewed with the built-in log viewer that can be started using launchLogViewer.

clearLoggers

Remove all registered loggers

Description

Remove all registered loggers

Usage

clearLoggers()

clusterApply

Apply a function to a list using the cluster

Description

Apply a function to a list using the cluster

Usage

```
clusterApply(cluster, x, fun, ..., stopOnError = FALSE, progressBar = TRUE)
```

4 clusterRequire

Arguments

cluster The cluster of threads to run the function.

x The list on which the function will be applied.

fun The function to apply. Note that the context in which the function is specifies

matters (see details).

... Additional parameters for the function.

stopOnError Stop when one of the threads reports an error? If FALSE, all errors will be

reported at the end.

progressBar Show a progress bar?

Details

The function will be executed on each element of x in the threads of the cluster. If there are more elements than threads, the elements will be queued. The progress bar will show the number of elements that have been completed. It can sometimes be important to realize that the context in which a function is created is also transmitted to the worker node. If a function is defined inside another function, and that outer function is called with a large argument, that argument will be transmitted to the worker node each time the function is executed. It can therefore make sense to define the function to be called at the package level rather than inside a function, to save overhead.

Value

A list with the result of the function on each item in x.

Examples

```
fun <- function(x) {
   return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

clusterRequire

Require a package in the cluster

Description

Calls the require function in each node of the cluster.

Usage

```
clusterRequire(cluster, package)
```

Arguments

cluster The cluster object.

package The name of the package to load in all nodes.

createArgFunction 5

|--|

Description

Create an argument function

Usage

```
createArgFunction(functionName, excludeArgs = c(), includeArgs = NULL,
  addArgs = list(), rCode = c(), newName)
```

Arguments

| functionName | The name of the function for which we want to create an args function. |
|--------------|--|
| excludeArgs | Exclude these arguments from appearing in the args function. |
| includeArgs | Include these arguments in the args function. |
| addArgs | Add these arguments to the args functions. Defined as a list with format name = default. |
| rCode | A character vector representing the R code where the new function should be appended to. |
| newName | The name of the new function. If not specified, the new name will be automati- |

Details

This function can be used to create a function that has (almost) the same interface as the specified function, and the output of this function will be a list of argument values.

Value

A character vector with the R code including the new function.

cally derived from the old name.

Examples

```
createArgFunction("read.csv", addArgs = list(exposureId = "exposureId"))
```

 ${\tt createConsoleAppender} \ \ {\it Create\ console\ appender}$

Description

Create console appender

Usage

```
createConsoleAppender(layout = layoutSimple)
```

6 createFileAppender

Arguments

layout The layout to be used by the appender.

Details

Creates an appender that will write to the console.

Examples

createFileAppender

Create file appender

Description

Create file appender

Usage

```
createFileAppender(layout = layoutParallel, fileName)
```

Arguments

layout The layout to be used by the appender.

fileName The name of the file to write to.

Details

Creates an appender that will write to a file.

createLogger 7

| createLogger Create a logger |
|------------------------------|
|------------------------------|

Description

Create a logger

Usage

```
createLogger(name = "SIMPLE", threshold = "INFO",
   appenders = list(createConsoleAppender()))
```

Arguments

name A name for the logger.

threshold The threshold to be used for reporting.

appenders A list of one or more appenders as created for example using the createConsoleAppender

or createFileAppender function.

Details

Creates a logger that will log messages to its appenders. The logger will only log messages at a level equal to or higher than its threshold. For example, if the threshold is "INFO" then messages marked "INFO" will be logged, but messages marked "TRACE" will not. The order of levels is "TRACE", "DEBUG", "INFO", "WARN", "ERROR, "and FATAL".

Value

An object of type Logger, to be used with the registerLogger function.

8 launchLogViewer

excludeFromList

Exclude variables from a list of objects of the same type

Description

Exclude variables from a list of objects of the same type

Usage

```
excludeFromList(x, exclude)
```

Arguments

x A list of objects of the same type.

exclude A character vector of names of variables to exclude.

getLoggers

Get all registered loggers

Description

Get all registered loggers

Usage

getLoggers()

Value

Returns all registered loggers.

launchLogViewer

Launch the log viewer Shiny app

Description

Launch the log viewer Shiny app

Usage

launchLogViewer(logFileName)

Arguments

logFileName

Name of the log file to view.

layoutParallel 9

Details

Launches a Shiny app that allows the user to view a log file created using the default file logger. Use addDefaultFileLogger to start the default file logger.

Examples

```
## Not run:
addDefaultFileLogger("log.txt")
logInfo("Hello world")
launchLogViewer("log.txt")
## End(Not run)
```

layoutParallel

Logging layout for parallel computing

Description

A layout function to be used with an appender. This layout adds the time, thread, level, package name, and function name to the message.

Usage

```
layoutParallel(level, message)
```

Arguments

level The level of the message (e.g. "INFO")

message The message to layout.

layoutSimple Simple logging layout

Description

A layout function to be used with an appender. This layout simply includes the message itself.

Usage

```
layoutSimple(level, message)
```

Arguments

level The level of the message (e.g. "INFO")

message The message to layout.

10 layoutTimestamp

| layoutStackTrace | Logging layout with stacktrace |
|------------------|------------------------------------|
| | 2000110 1111 11111 511111111111111 |

Description

A layout function to be used with an appender. This layout adds the strack trace to the message.

Usage

```
layoutStackTrace(level, message)
```

Arguments

level The level of the message (e.g. "INFO")

message The message to layout.

layoutTimestamp Logging layout with timestamp

Description

A layout function to be used with an appender. This layout adds the time to the message.

Usage

```
layoutTimestamp(level, message)
```

Arguments

level The level of the message (e.g. "INFO")

message The message to layout.

loadSettingsFromJson 11

loadSettingsFromJson Load a settings object from a JSON file

Description

Load a settings object from a JSON file

Usage

loadSettingsFromJson(fileName)

Arguments

fileName

Name of the JSON file to load.

Details

Load a settings object from a JSON file, restoring object classes and attributes.

Value

An R object as specified by the JSON.

logDebug

Log a message at the DEBUG level

Description

Log a message at the DEBUG level

Usage

```
logDebug(...)
```

Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers.

12 logFatal

logError

Log a message at the ERROR level

Description

Log a message at the ERROR level

Usage

```
logError(...)
```

Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers.

logFatal

Log a message at the FATAL level

Description

Log a message at the FATAL level

Usage

```
logFatal(...)
```

Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers. This function is be automatically called when an error occurs, and should not be called directly. Use stop() instead.

logInfo

logInfo

Log a message at the INFO level

Description

Log a message at the INFO level

Usage

```
logInfo(...)
```

Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers.

Examples

logTrace

Log a message at the TRACE level

Description

Log a message at the TRACE level

Usage

```
logTrace(...)
```

Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers.

14 makeCluster

Examples

logWarn

Log a message at the WARN level

Description

Log a message at the WARN level

Usage

```
logWarn(...)
```

Arguments

... Zero or more objects which can be coerced to character (and which are pasted together with no separator).

Details

Log a message at the specified level. The message will be sent to all the registered loggers. This function is automatically called when a warning is thrown, and should not be called directly. Use warning() instead.

makeCluster

Create a cluster of nodes for parallel computation

Description

Create a cluster of nodes for parallel computation

Usage

```
makeCluster(numberOfThreads, singleThreadToMain = TRUE,
    divideFfMemory = TRUE, setFfTempDir = TRUE)
```

matchInList 15

Arguments

numberOfThreads

Number of parallel threads.

singleThreadToMain

If numberOfThreads is 1, should we fall back to running the process in the main

thread?

divideFfMemory When TRUE, the memory available for processing ff and ffdf objects will be

equally divided over the threads.

setFfTempDir When TRUE, the ffTempDir option will be copied to each thread.

Value

An object representing the cluster.

Examples

```
fun <- function(x) {
  return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

matchInList

In a list of object of the same type, find those that match the input

Description

In a list of object of the same type, find those that match the input

Usage

```
matchInList(x, toMatch)
```

Arguments

x A list of objects of the same type.

toMatch The object to match.

Details

Typically, toMatch will contain a subset of the variables that are in the objects in the list. Any object matching all variables in toMatch will be included in the result.

Value

A list of objects that match the toMatch object.

16 registerLogger

Examples

ParallelLogger

ParallelLogger

Description

ParallelLogger

registerLogger

Register a logger

Description

Register a logger

Usage

```
registerLogger(logger)
```

Arguments

logger

An object of type Logger as created using the createLogger function.

Details

Registers a logger as created using the createLogger function to the logging system.

runAndNotify 17

| runAndNotify | Run code and send e-mail notification on error, warning, or completion |
|--------------|--|
| runAndNotify | |

Description

Run code and send e-mail notification on error, warning, or completion

Usage

```
runAndNotify(expression, mailSettings, label = "R", stopOnWarning = FALSE)
```

Arguments

| expression | The expression to run. |
|---------------|--|
| mailSettings | Arguments to be passed to the send.mail function in the mailR package (except subject and body). |
| label | A label to be used in the subject to identify a run. |
| stopOnWarning | Stop expression on warning and send notification? |

Value

The output of expression.

18 selectFromList

saveSettingsToJson

Save a settings object as JSON file

Description

Save a settings object as JSON file

Usage

```
saveSettingsToJson(object, fileName)
```

Arguments

object R object to be saved.

fileName File name where the object should be saved.

Details

Save a setting object as a JSON file, using pretty formatting and preserving object classes and attributes.

selectFromList

Select variables from a list of objects of the same type

Description

Select variables from a list of objects of the same type

Usage

```
selectFromList(x, select)
```

Arguments

x A list of objects of the same type.

select A character vector of names of variables to select.

stopCluster 19

```
# # $b $name # [1] "Mary" # $b$age # [1] 24
```

stopCluster

Stop the cluster

Description

Stop the cluster

Usage

```
stopCluster(cluster)
```

Arguments

cluster

The cluster to stop

Examples

```
fun <- function(x) {
  return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

unregister Logger

Unregister a logger

Description

Unregister a logger

Usage

```
unregisterLogger(x)
```

Arguments

Χ

Can either be an integer (e.g. 2 to remove the second logger), the name of the logger, or the logger object itself.

20 unregisterLogger

Details

Unregisters a logger from the logging system.

Value

Returns TRUE if the logger was removed.
