# Package 'ParallelLogger'

July 2, 2018

Type Package

Title Support for Parallel Computation, Logging, and Function Automation
Version 1.0.0
<b>Date</b> 2018-07-02
Maintainer Martijn Schuemie <schuemie@ohdsi.org></schuemie@ohdsi.org>
<b>Description</b> Support for parallel computation with progress bar, and option to stop or proceed on errors. Also provides logging to console and disk, and the logging persists in the parallel threads. Additional functions support function call automation with delayed execution (e.g. for executing functions in parallel).
License Apache License 2.0
VignetteBuilder knitr
<b>Depends</b> R (>= 3.1.0)
Imports snow,  XML,  jsonlite,  methods,  utils,  mailR
Suggests testthat, shiny, DT, knitr, rmarkdown
NeedsCompilation no
RoxygenNote 6.0.1.9000

 ${\it addDefaultConsoleLogger}$ 

Add the default console logger

### Description

Add the default console logger

### Usage

**Index** 

addDefaultConsoleLogger()

#### **Details**

Creates a logger that writes to the console using the "INFO" threshold and the layoutSimple layout.

```
logger <- addDefaultConsoleLogger()
registerLogger(logger)
logTrace("This event is below the threshold (INFO)")
logInfo("Hello world")
unregisterLogger(logger)</pre>
```

addDefaultFileLogger 3

```
addDefaultFileLogger Add the default file logger
```

#### **Description**

Add the default file logger

### Usage

```
addDefaultFileLogger(fileName)
```

### Arguments

fileName

The name of the file to write to.

#### **Details**

Creates a logger that writes to a file using the "TRACE" threshold and the layoutParallel layout. The output can be viewed with the built-in log viewer that can be started using launchLogViewer.

clearLoggers

Remove all registered loggers

### Description

Remove all registered loggers

#### Usage

clearLoggers()

clusterApply

Apply a function to a list using the cluster

### Description

Apply a function to a list using the cluster

### Usage

```
clusterApply(cluster, x, fun, ..., stopOnError = FALSE, progressBar = TRUE)
```

4 clusterRequire

#### **Arguments**

cluster The cluster of threads to run the function.

x The list on which the function will be applied.

fun The function to apply. Note that the context in which the function is specifies

matters (see details).

... Additional parameters for the function.

stopOnError Stop when one of the threads reports an error? If FALSE, all errors will be

reported at the end.

progressBar Show a progress bar?

#### **Details**

The function will be executed on each element of x in the threads of the cluster. If there are more elements than threads, the elements will be queued. The progress bar will show the number of elements that have been completed. It can sometimes be important to realize that the context in which a function is created is also transmitted to the worker node. If a function is defined inside another function, and that outer function is called with a large argument, that argument will be transmitted to the worker node each time the function is executed. It can therefore make sense to define the function to be called at the package level rather than inside a function, to save overhead.

#### Value

A list with the result of the function on each item in x.

#### **Examples**

```
fun <- function(x) {
   return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

clusterRequire

Require a package in the cluster

#### **Description**

Calls the require function in each node of the cluster.

#### Usage

```
clusterRequire(cluster, package)
```

### Arguments

cluster The cluster object.

package The name of the package to load in all nodes.

createArgFunction 5

|--|

#### **Description**

Create an argument function

### Usage

```
createArgFunction(functionName, excludeArgs = c(), includeArgs = NULL,
  addArgs = list(), rCode = c(), newName)
```

#### **Arguments**

functionName	The name of the function for which we want to create an args function.
excludeArgs	Exclude these arguments from appearing in the args function.
includeArgs	Include these arguments in the args function.
addArgs	Add these arguments to the args functions. Defined as a list with format name = default.
rCode	A character vector representing the R code where the new function should be appended to.
newName	The name of the new function. If not specified, the new name will be automati-

#### **Details**

This function can be used to create a function that has (almost) the same interface as the specified function, and the output of this function will be a list of argument values.

#### Value

A character vector with the R code including the new function.

cally derived from the old name.

### **Examples**

```
createArgFunction("read.csv", addArgs = list(exposureId = "exposureId"))
```

 ${\tt createConsoleAppender} \ \ {\it Create\ console\ appender}$ 

### Description

Create console appender

### Usage

```
createConsoleAppender(layout = layoutSimple)
```

6 createFileAppender

#### **Arguments**

layout The layout to be used by the appender.

#### **Details**

Creates an appender that will write to the console.

### **Examples**

createFileAppender

Create file appender

### Description

Create file appender

### Usage

```
createFileAppender(layout = layoutParallel, fileName)
```

### **Arguments**

layout The layout to be used by the appender.

fileName The name of the file to write to.

### **Details**

Creates an appender that will write to a file.

createLogger 7

createLogger Create a logger
------------------------------

#### **Description**

Create a logger

#### Usage

```
createLogger(name = "SIMPLE", threshold = "INFO",
   appenders = list(createConsoleAppender()))
```

#### **Arguments**

name A name for the logger.

threshold The threshold to be used for reporting.

appenders A list of one or more appenders as created for example using the createConsoleAppender

or createFileAppender function.

#### **Details**

Creates a logger that will log messages to its appenders. The logger will only log messages at a level equal to or higher than its threshold. For example, if the threshold is "INFO" then messages marked "INFO" will be logged, but messages marked "TRACE" will not. The order of levels is "TRACE", "DEBUG", "INFO", "WARN", "ERROR, "and FATAL".

#### Value

An object of type Logger, to be used with the registerLogger function.

8 launchLogViewer

excludeFromList

Exclude variables from a list of objects of the same type

#### **Description**

Exclude variables from a list of objects of the same type

### Usage

```
excludeFromList(x, exclude)
```

### **Arguments**

x A list of objects of the same type.

exclude A character vector of names of variables to exclude.

getLoggers

Get all registered loggers

### Description

Get all registered loggers

### Usage

getLoggers()

#### Value

Returns all registered loggers.

launchLogViewer

Launch the log viewer Shiny app

### Description

Launch the log viewer Shiny app

### Usage

launchLogViewer(logFileName)

### **Arguments**

logFileName

Name of the log file to view.

layoutParallel 9

#### **Details**

Launches a Shiny app that allows the user to view a log file created using the default file logger. Use addDefaultFileLogger to start the default file logger.

#### **Examples**

```
## Not run:
addDefaultFileLogger("log.txt")
logInfo("Hello world")
launchLogViewer("log.txt")
## End(Not run)
```

layoutParallel

Logging layout for parallel computing

### **Description**

A layout function to be used with an appender. This layout adds the time, thread, level, package name, and function name to the message.

#### Usage

```
layoutParallel(level, message)
```

#### **Arguments**

level The level of the message (e.g. "INFO")

message The message to layout.

layoutSimple Simple logging layout

### Description

A layout function to be used with an appender. This layout simply includes the message itself.

#### Usage

```
layoutSimple(level, message)
```

#### **Arguments**

level The level of the message (e.g. "INFO")

message The message to layout.

10 layoutTimestamp

layoutStackTrace	Logging layout with stacktrace
	2000110 1111 11111 511111111111111

### Description

A layout function to be used with an appender. This layout adds the strack trace to the message.

### Usage

```
layoutStackTrace(level, message)
```

#### **Arguments**

level The level of the message (e.g. "INFO")

message The message to layout.

layoutTimestamp Logging layout with timestamp

### **Description**

A layout function to be used with an appender. This layout adds the time to the message.

### Usage

```
layoutTimestamp(level, message)
```

### **Arguments**

level The level of the message (e.g. "INFO")

message The message to layout.

loadSettingsFromJson 11

loadSettingsFromJson Load a settings object from a JSON file

#### **Description**

Load a settings object from a JSON file

### Usage

loadSettingsFromJson(fileName)

### Arguments

fileName

Name of the JSON file to load.

#### **Details**

Load a settings object from a JSON file, restoring object classes and attributes.

#### Value

An R object as specified by the JSON.

logDebug

Log a message at the DEBUG level

### Description

Log a message at the DEBUG level

### Usage

```
logDebug(...)
```

### Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

#### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers.

12 logFatal

logError

Log a message at the ERROR level

### Description

Log a message at the ERROR level

### Usage

```
logError(...)
```

#### **Arguments**

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

#### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers.

logFatal

Log a message at the FATAL level

### **Description**

Log a message at the FATAL level

### Usage

```
logFatal(...)
```

#### **Arguments**

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

#### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers. This function is be automatically called when an error occurs, and should not be called directly. Use stop() instead.

logInfo

logInfo

Log a message at the INFO level

#### **Description**

Log a message at the INFO level

#### Usage

```
logInfo(...)
```

#### **Arguments**

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

#### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers.

### **Examples**

logTrace

Log a message at the TRACE level

### Description

Log a message at the TRACE level

#### Usage

```
logTrace(...)
```

### Arguments

Zero or more objects which can be coerced to character (and which are pasted together with no separator).

### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers.

14 makeCluster

#### **Examples**

logWarn

Log a message at the WARN level

#### **Description**

Log a message at the WARN level

#### Usage

```
logWarn(...)
```

### **Arguments**

... Zero or more objects which can be coerced to character (and which are pasted together with no separator).

#### **Details**

Log a message at the specified level. The message will be sent to all the registered loggers. This function is automatically called when a warning is thrown, and should not be called directly. Use warning() instead.

makeCluster

Create a cluster of nodes for parallel computation

#### **Description**

Create a cluster of nodes for parallel computation

### Usage

```
makeCluster(numberOfThreads, singleThreadToMain = TRUE,
    divideFfMemory = TRUE, setFfTempDir = TRUE)
```

matchInList 15

#### **Arguments**

numberOfThreads

Number of parallel threads.

singleThreadToMain

If numberOfThreads is 1, should we fall back to running the process in the main

thread?

divideFfMemory When TRUE, the memory available for processing ff and ffdf objects will be

equally divided over the threads.

setFfTempDir When TRUE, the ffTempDir option will be copied to each thread.

#### Value

An object representing the cluster.

### **Examples**

```
fun <- function(x) {
  return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

matchInList

In a list of object of the same type, find those that match the input

### Description

In a list of object of the same type, find those that match the input

### Usage

```
matchInList(x, toMatch)
```

#### **Arguments**

x A list of objects of the same type.

toMatch The object to match.

#### **Details**

Typically, toMatch will contain a subset of the variables that are in the objects in the list. Any object matching all variables in toMatch will be included in the result.

### Value

A list of objects that match the toMatch object.

16 registerLogger

#### **Examples**

ParallelLogger

ParallelLogger

#### **Description**

ParallelLogger

registerLogger

Register a logger

#### **Description**

Register a logger

### Usage

```
registerLogger(logger)
```

### **Arguments**

logger

An object of type Logger as created using the createLogger function.

### **Details**

Registers a logger as created using the createLogger function to the logging system.

runAndNotify 17

runAndNotify	Run code and send e-mail notification on error, warning, or completion
runAndNotify	

### Description

Run code and send e-mail notification on error, warning, or completion

### Usage

```
runAndNotify(expression, mailSettings, label = "R", stopOnWarning = FALSE)
```

### Arguments

expression	The expression to run.
mailSettings	Arguments to be passed to the send.mail function in the mailR package (except subject and body).
label	A label to be used in the subject to identify a run.
stopOnWarning	Stop expression on warning and send notification?

#### Value

The output of expression.

18 selectFromList

saveSettingsToJson

Save a settings object as JSON file

### **Description**

Save a settings object as JSON file

#### Usage

```
saveSettingsToJson(object, fileName)
```

### Arguments

object R object to be saved.

fileName File name where the object should be saved.

#### **Details**

Save a setting object as a JSON file, using pretty formatting and preserving object classes and attributes.

selectFromList

Select variables from a list of objects of the same type

### Description

Select variables from a list of objects of the same type

### Usage

```
selectFromList(x, select)
```

#### **Arguments**

x A list of objects of the same type.

select A character vector of names of variables to select.

stopCluster 19

```
# # $b $name # [1] "Mary" # $b$age # [1] 24
```

stopCluster

Stop the cluster

### Description

Stop the cluster

### Usage

```
stopCluster(cluster)
```

### **Arguments**

cluster

The cluster to stop

### **Examples**

```
fun <- function(x) {
  return (x^2)
}

cluster <- makeCluster(numberOfThreads = 3)
clusterApply(cluster, 1:10, fun)
stopCluster(cluster)</pre>
```

unregister Logger

Unregister a logger

### Description

Unregister a logger

### Usage

```
unregisterLogger(x)
```

### Arguments

Χ

Can either be an integer (e.g. 2 to remove the second logger), the name of the logger, or the logger object itself.

20 unregisterLogger

### **Details**

Unregisters a logger from the logging system.

#### Value

Returns TRUE if the logger was removed.
